

Network Management Method, Apparatus of Same and Network Systems

Abstract Of The Disclosure

A network management method for performing communication between any nodes in a network wherein a plurality of nodes are connected, said network management method characterized in that: a connection request having at least a logical node name of the destination of connection is successively propagated to a node having a possibility of active connection with the node of the destination of connection based on information on nodes in the vicinity of that node stored in each node; a route for actively connecting desired nodes is searched for; and the nodes are made to actively connect and communication between the nodes is made to be performed.
